Application

Level limit detection

Maximum or minimum detection in tanks or pipes containing all kinds of liquids from cold to very hot. The devices are also suitable for use in hazardous areas and for applications with high pressures.

L00-FTL7xxxx-11-05-xx-xx-001

Function and system design

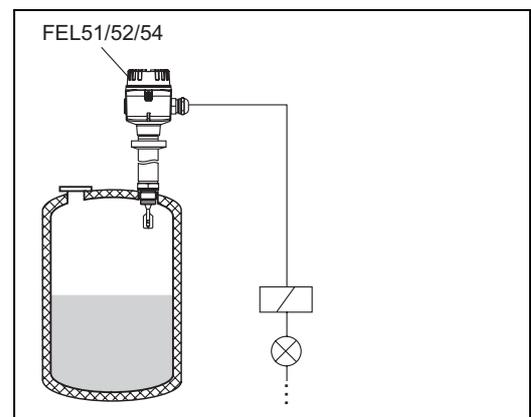

Measuring principle

The sensor's fork vibrates at its intrinsic frequency. This frequency is reduced when covered with liquid. This change in frequency causes the limit switch to switch.

Installation

Installation instructions

Switch points \triangleright on the sensor depend on the mounting position, with reference to water, Density 1 g/cm³, 23 °C, p_e 0 bar.

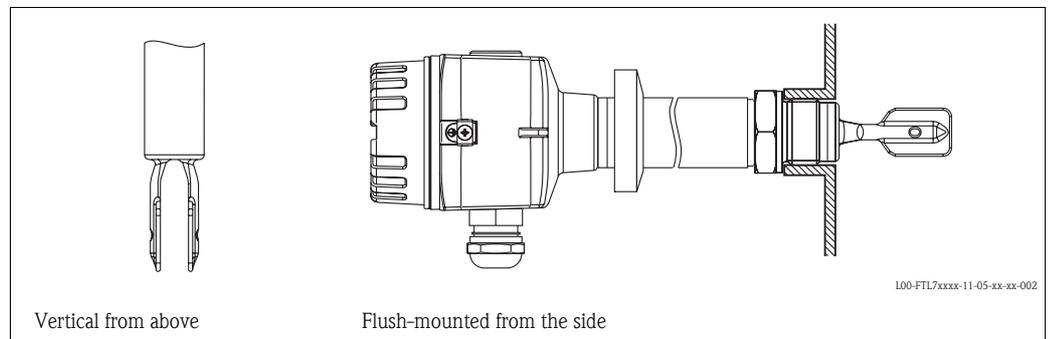

Note!
Switch points of the Liquiphant S FTL70/71 are at other positions to those of the previous version FDL60/61.

Examples of mounting

Examples of mounting with regard to the viscosity ν of the liquid and the tendency to form buildup

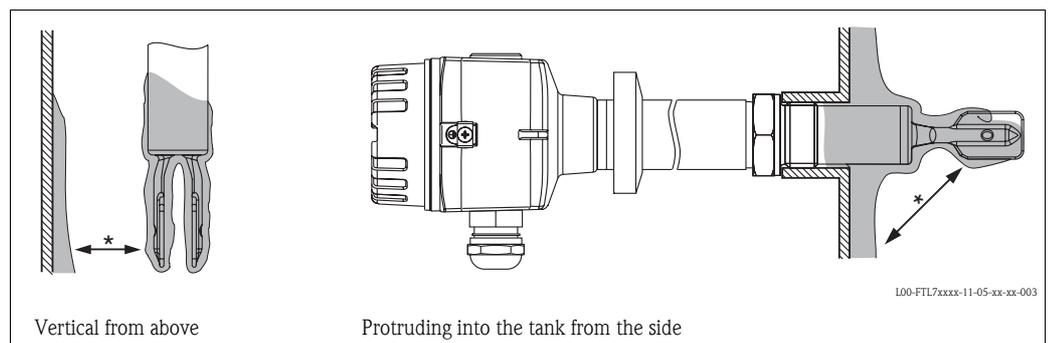

Optimum mounting, without problem even with high viscosity:

Position the fork so that the narrow edge of the tines is vertical. This ensures that the liquid can run off easily.

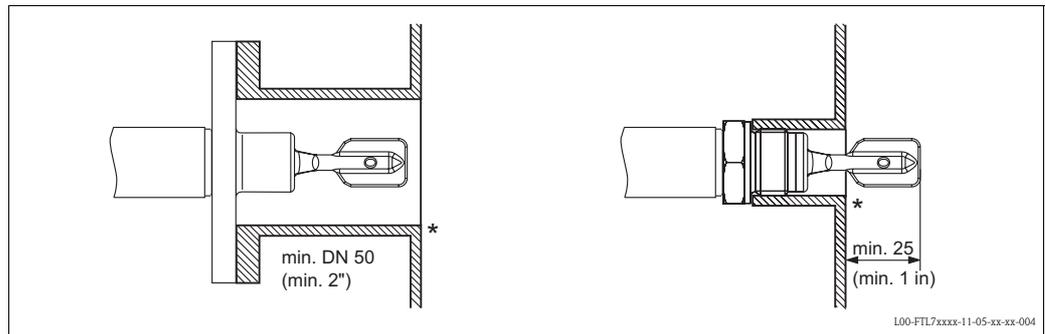

With buildup on the tank walls:

* Ensure that there is sufficient distance between the buildup expected on the tank wall and the fork.

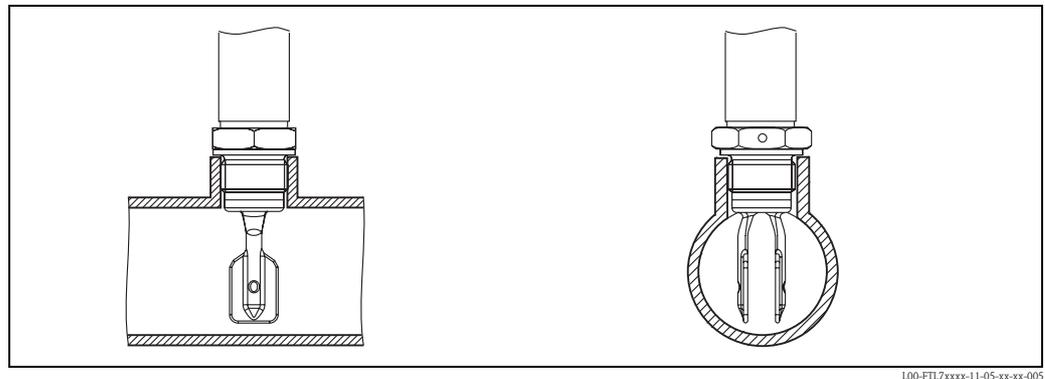

Mounting positions with low viscosity (up to 2000 mm²/s):

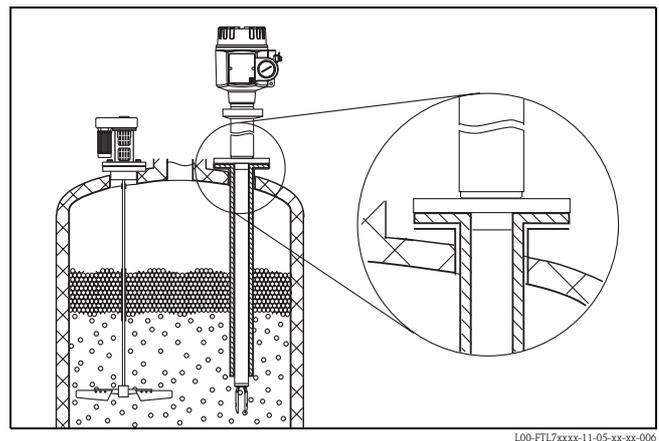

* Deburr the nozzle surfaces

**Mounting in piping from 2":**

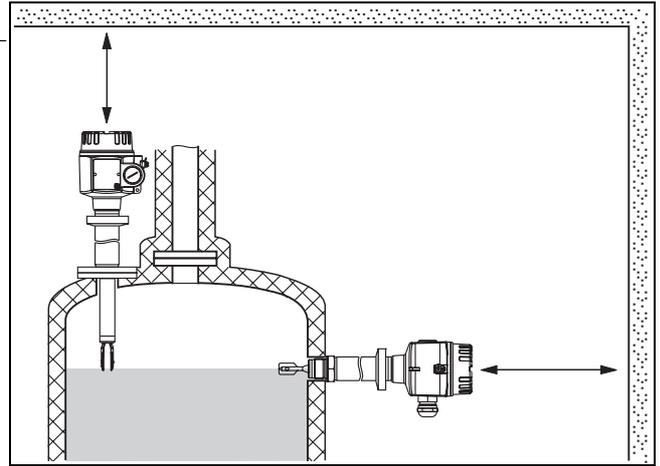

Fluid velocities up to 5 m/s for viscosity 1 mm²/s and density 1 g/cm³.
(Check the function for other process conditions.)

Support the Liquiphant S FTL71
in the event of severe dynamic load.

Ensure adequate space outside the tank for mounting, connection and configuration.

Electrical connecting cables run in pipes:

Do not screw cable entries firmly to the piping. Use flexible connections (e.g. with armored hose).

If piping is used for grounding, then ensure that there is a continuous electrical connection.
