

Technical information

version 11.04

**GEL 260****GEL 260 EEx**

Incremental encoders convert rotations into electric signals. The Lenord + Bauer encoders combine the advantages of a magnetic measuring system and a robust mechanical design. They have proven successful all over the world in many different applications and even under roughest industrial conditions. Their high reliability and a long service life go without saying.

Fields of application

- Heavy industry
- Paper-making and packaging machines
- Filling machines
- Transporting and storing systems
- Machines for processing steel, wood, stone, textiles and plastic, etc.

Main characteristics

- Up to 10,240 pulses per revolution (40,960 with external four-edge evaluation)
- More than 1,400 various pulse numbers
- Additionally current output
0 ... 20 mA, 4 ... 20 mA, -20 ... +20 mA (option)
- Reference signal
- Cable or plug outlet, axial or radial
- High electromagnetic compatibility (EMC)
- For use in explosion hazardous areas (option)

Measuring principle

The encoders work with differential sensors depending on magnetic fields and a precision toothed wheel as measure. The sensors scan the tooth structure of the toothed wheel and emit a sine or cosine voltage. The integrated evaluation electronics in ASIC and SMD technology converts the analogue sensor signals into incremental output signals.

Advantages of the magnetic system

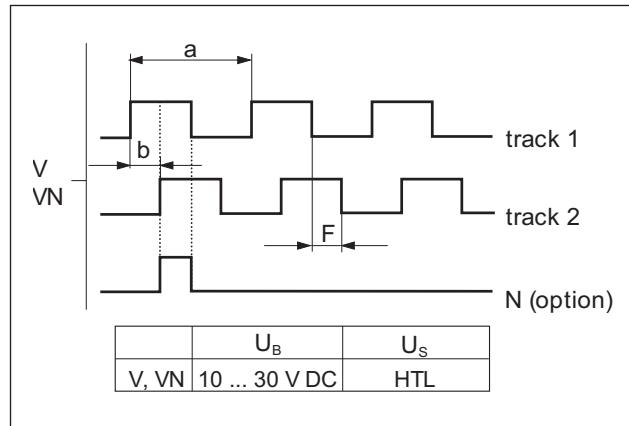

- No adverse effect due to condensed water
- Absolute operational reliability even in case of high humidity (dewing) and frequent change of ambient temperature
- Extremely insensitive to dirt, oil and water
- Extremely shock- and vibration-resistant because the measure is not made of glass nor plastic
- Outstanding operational safety over a very long period of time as it does not suffer from ageing effects as optical systems do

Output signals

Signal pattern V, VN

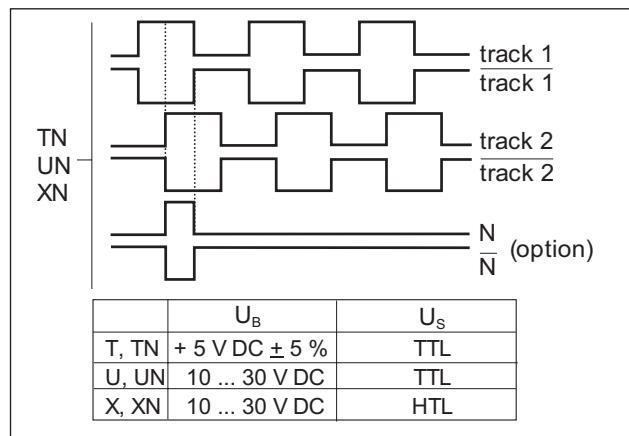

Signal pattern "V" stands for two tracks with square-wave signals, offset by 90° (push-pull output). With each revolution, a reference signal with defined length is put out on the third track N (optionally).

At an output frequency of 200 kHz the edge distance (F) is $\geq 0.6 \mu\text{s}$.

Signal pattern T, TN, U, UN, X, XN

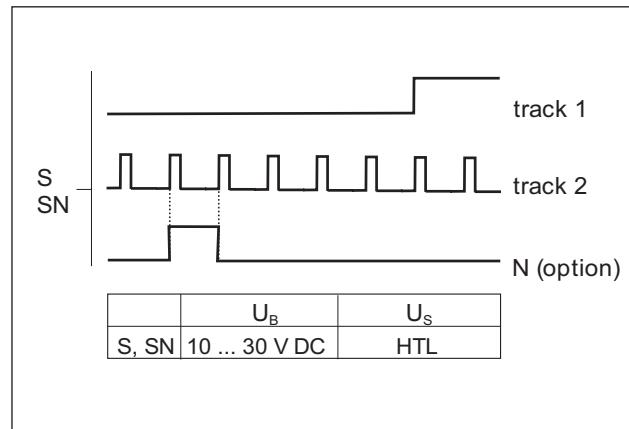

Both tracks and the reference signal (option) are additionally output as inverse signals.

Signal pattern S, SN

Pulses which are independent of the rotational direction and the duration of which is constant are derived from the square-wave signals as per signal pattern V and put out on track 2. Furthermore, a signal depending on the rotational direction is obtained from the signal pattern which is put on track 1.

Once per each revolution a reference signal is output on the third track N (optional). The outputs have a final push-pull power stage. All outputs are sustained short-circuit-proof. The pulses follow a possible change of rotation with a slight delay, in order that a subsequent counter setting can be adjusted to the counting direction prior to the pulse. The sense-dependent signal may be reversed via a switch which is accessible from outside (switch 1).

Key

- U_B = operating voltage
- U_S = signal voltage
- a = 360° electrical
- b = 90° phase shift
- F = edge distance (for an output frequency of 200 kHz the edge distance is $F > 0.6 \mu\text{s}$)

Signal pattern = shown for clockwise rotation (view on top of the encoder shaft)

Reference signals with other lengths upon request.

Output level

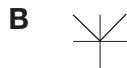

The signal patterns V, VN, X and XN have HTL level, the signal patterns T, TN, U and UN have TTL level (for the output voltage see electrical data).

All outputs have a push-pull power amplifier and are short-circuit-proof. The peak output current for recharging the cable capacity is 100 mA.

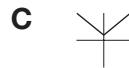

Various current outputs

Measuring current which is independent on the sense of rotation and which has a nominal range of -20 ... +20 mA. The polarity of the current can be reversed by switch 1 which is accessible from outside.

Measuring current which is independent of the sense of rotation and which has a nominal range of 0 ... +20 mA.

Measuring current which is independent of the sense of rotation and which has a nominal range of +4 ... +20 mA.

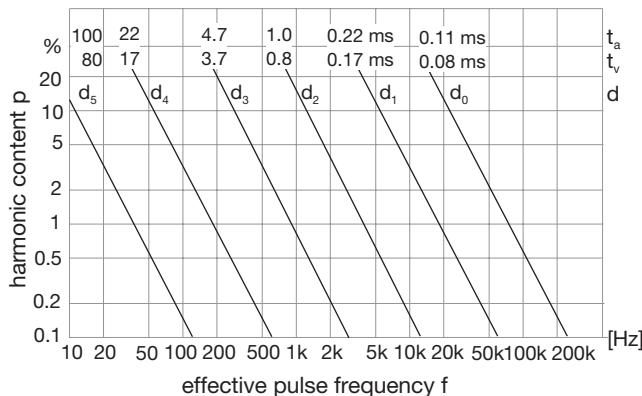

! The switch position deviates from the one of the previous model, i. e. GEL 262. If the device is preset in the factory and in case of clockwise rotation the specified signals are valid.

Current output

For displaying and controlling a standardized measuring current of 0 ... 20 mA, 4 ... 20 mA or -20 ... +20 mA which depends on the speed and sometimes on the sense of rotation can be obtained from the pulse frequency. For this purpose the pulse frequency is integrated and converted into an applied current. This results in a strictly linear interrelation between the measuring current and the pulse frequency. Because of the high resolution (up to 40,000 pulses per revolution, each pulse being dependent on the sense of rotation) a

standard measuring current with a low harmonic content is obtained at a very low speed range (e.g. 0 ... 0.5 min⁻¹) already.

The harmonic content of the output DC depends on the pulse frequency as well as on the chosen attenuation, latter influencing the rise, fall and delay time in case of the speed changing erratically. Attenuation may be specified when ordering corresponding to the above diagram, d_3 is the default setting.

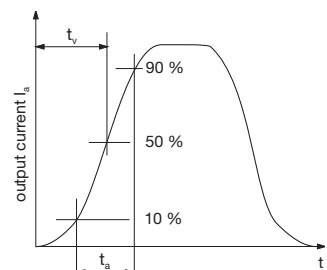

t_a = rise time
 t_v = delay time
 d = attenuation

$$t_a, t_v = f(d)$$

$$p = I_{eff} / I_a$$

$$f = n \cdot i \text{ [Hz]}$$

Dimensioned drawings, version EEx

Protection of the electronic (optional),

Protection of the electronics (optional)

Protection against humidity

The encoders' electronic unit is coated with a highly effective protection against humidity, salt-water atmosphere and corrosive vapours to ensure their proper functioning during years even under roughest conditions.

Condensed-water outlet

Water may accumulate in the encoder if it is exposed to multiple dewing. The water can drain off through the condensed-water outlet. When mounting the encoder the outlet must show downward. The protection class drops to IP 64.

Protection against vibration

The additional fixing of mechanical parts with special plastic prevents the electronics and the connections inside the encoder from vibrating. Thus the proper and continuous operation of the encoder - even if exposed to extreme vibration and shock - is guaranteed.

Version GEL 260 EEx

Through mounting of the GEL 260 in a flameproof housing Ex-protection to VDE 0171.

Order details GEL 260

260	-	-	-	-	-	-	-	-	description
temperature range									
1 0°C ... +70°C									
3 -20°C ... +85°C (option)									
protection of the electronics									
0 without any additional protection (standard)									
1 moisture-proof									
2 vibration-proof									
3 moisture- and vibration-proof									
4 moisture-proof of incl. condensed-water outlet									
5 moisture- and vibration-proof and condensed-water outlet									
6 protection class EExd with GEL 260 no additional protection									
7 protection class EExd with GEL 260 and moisture protected									
8 protection class EExd with GEL 260 and vibration protected									
9 protection class EExd with GEL 260 and protection against moisture and vibration									
shaft diameter / length									
0 Ø = 12 mm L = 30 mm (standard)									
1 Ø = 6 mm L = 13 mm									
2 Ø = 8 mm L = 30 mm									
3 Ø = 8 mm L = 30 mm shaft additionally fitted with Woodruff key DIN 6888									
4 Ø = 10 mm L = 30 mm									
5 Ø = 10 mm L = 30 mm shaft additionally fitted with Woodruff key DIN 6888									
7 Ø = 12 mm L = 30 mm shaft additionally fitted with Woodruff key DIN 6888									
9 Ø = 12 mm L = 23 mm (only by GEL 260 EEx)									
plug / cable outlet									
A 6-pole plug, axial									
B 6-pole plug, radial									
C 12-pole plug, axial									
D 12-pole plug, radial									
E 7-core cable (only by GEL 260 EEx)									
F 6-core cable, axial									
G 6-core cable, radial									
H 10-core cable, axial									
I 10-core cable, radial									
K 12-core cable (only by GEL 260 EEx)									
pulse number per revolution (see previous page)									
reference signal									
- without reference signal (standard)									
N incl. reference signal (option)									
signal pattern (see page 2)									
- without reference signal (standard)									
S $U_B = 10 \dots 30 \text{ V DC}$, logic level HTL									
T $U_B = 5 \text{ V DC}$, logic level TTL									
U $U_B = 10 \dots 30 \text{ V DC}$, logic level TTL									
V $U_B = 10 \dots 30 \text{ V DC}$, logic level TTL									
X $U_B = 10 \dots 30 \text{ V DC}$, logic level HTL									
current output									
- without									
A -20 mA ... +20 mA									
B 0 mA ... +20 mA									
C +4 mA ... +20 mA									

Order details

Standard cable length: 1metre. Please state in your order, if you wish other cable lengths. GG 66 or GG 126 are included in the scope of supply; if you wish GG 66 (option), please state in your order.

Order example

260 C V N 01000 A 0 3 3 or 260 - X N 01024 H 4 0 1 with 3 m cable.

Subject to technical modifications and typographical errors.
